

New Mobility

We invest in the future

- Coating Solutions for the Battery Management System
- Coating Solutions for Fuel Cells
- Coating with Sensor Function

Solutions for the Battery Management System

The Wörwag product portfolio offers an optimal solution for the components of the battery management system: battery housings, covers or cellular modules. Our core products: liquid paint, powder coating and the repair solution with paint film. All technologies meet the requirements of excellent insulation performance with only one layer and high process stability. In addition our 100 % systems guarantee recyclability and high resistance to external impacts through excellent adhesion to the substrate.

Bipolar Plate by Paint Film

The automotive industry is facing massive changes and is forced to move their focus to innovative technologies. So the fuel cell is one of the keys to eco-friendly mobility. It generates electricity from water cycles. The current process is too complex for large-scale production and reaches the limits of economic efficiency due to long process times. Short cycle times and high-speed series productions are key advantages of our coatings. Compact cells by applying thin layers can significantly increase the performance of fuel cells.

Smart Solutions Enabling Digital Transformation

The mobility of the future will be electric, connected, self-driving and digital. The increasing speed of digital transformation has reached the product world of Wörwag coatings. With our innovative coating system, we give the coating a voice. By recording the condition of the surface, we offer you the digital lead. No matter if mechanical impact, liquid substances or inadequate contact – changes on the surface can be digitally mapped. Real-time monitoring through the connectivity of the vehicle enables cross-divisional cost and time savings.
